Udyam Digital · on Airtel SYNC — rules decide, AI explains

Next.js app on Vercel. Price, eligibility, KYC verdicts and order state come from deterministic, tested code. Gemini only reads words and pages and writes the explanation — and every number it writes is checked against the engine.

Trust layer, enforced in server code

Consent gate per purpose (KYC · service · DigiLocker · marketing off) · identifiers masked in UI and logs · advisor AI never gets phone or GSTIN; pages reach the vision model only after KYC consent · RBAC + audit
Signed webhooks (Meta, Twilio, Telegram) · OTP limits (30 s cooldown, 4/h, 5 tries, single use) · fail-closed: a missing key refuses, nothing is faked · one-tap export and delete-my-data

Red marks the path that decides money: the rules engine is the only source of price and eligibility; Gemini's facts go in, its draft is checked on the way out. Dashed grey boxes are the case's supplied data (GSTIN/Udyam lookups are mocked, as the brief asks). Today = 2026-07-15 for all date checks.
